

Dubic Hub

A simple, focused design brief for the restaurant web-app project — covering the tools we'll use and the three device frames we're designing for: Mobile App, iPad / Tablet, and Desktop Website.

Project Summary

Dubic Hub is a fictional restaurant web-app built by a 6-person team for a shared project, using HTML, CSS, and JavaScript. This brief keeps the design process simple: one tool, one shared file, three clear frame sets so everyone designs to the same sizes before development starts.

Goal

Design consistent, on-brand screens across mobile, tablet, and desktop before any code is written, so development follows a single visual source of truth.

Brand Palette

Brown as the primary/accent color, black for text and contrast, and a warm off-white background (not stark #ffffff) for a softer, restaurant-appropriate feel.

Figma

DESIGN & PROTOTYPE

Why Figma for this project

Figma is free for small teams, runs in the browser (no installs needed for 6 different laptops), and lets everyone design inside one shared file at the same time. It has built-in frame presets for mobile, tablet, and desktop, plus components and shared color/text styles so the brown/white/black palette stays consistent across every screen.

FEATURE	HOW WE'LL USE IT
Shared File	One Figma file for the whole team — everyone works in the same place, no version mix-ups.
Pages	Separate Figma "Pages" for Mobile, Tablet, and Desktop so frames don't get cluttered.
Styles	Save the brown / white / black palette and fonts as shared Color & Text Styles.
Components	Buttons, nav bars, and menu cards built once as components, reused everywhere.
Comments	Team feedback left directly on frames instead of separate chat threads.
Handoff	Inspect mode gives exact spacing, colors, and CSS values when we start coding.

The Three Frames

We're designing for three device sizes. Each one gets its own Figma frame set using Figma's built-in presets, so layouts stay accurate to real screen sizes from day one.

M Mobile App

375 × 812 px

Primary way most customers will browse the menu and order. Figma preset: **iPhone 14 / 375 x 812**. Single-column layout, bottom nav bar, large tap targets.

T iPad / Tablet

834 × 1194 px

A middle-ground layout — more breathing room than mobile, but not a full desktop grid. Figma preset: **iPad Pro 11" / 834 x 1194**. Two-column menu grid, side navigation optional.

D Desktop Website

1440 × 1024 px

Full browsing experience with the widest layout. Figma preset: **Desktop / 1440 x 1024**. Top nav bar, multi-column menu grid, larger hero imagery.

Core Screens To Design (Each Frame)

Design the same core screens across all three frame sizes so the app feels consistent no matter which device it's viewed on.

- **Home / Landing** — restaurant intro, hero image, quick links to menu and booking.
- **Menu** — food categories, item cards with photo, name, and price.
- **Item Detail** — larger photo, description, price, add-to-order action.
- **Cart / Order Summary** — selected items, quantities, total.
- **Reservation / Contact** — booking form and location/contact info.

WORKFLOW

Next Steps

1 Set up the shared Figma file

Create one team file, invite all 6 members, and set up the color/text styles first.

2 Design Mobile first

Start with the smallest frame — it forces the simplest, clearest version of each screen.

3 Adapt to Tablet, then Desktop

Reuse mobile components and expand the layout as space allows for each larger frame.

4 Review as a team

Walk through all three frame sets together, leave comments in Figma, and lock the final versions.

5 Hand off to development

Use Figma's Inspect panel to pull exact spacing, colors, and sizing into the HTML/CSS build.
